

Business Problem Statement

A leading organization wants to analyze the current job market trends in the Data Science and Analytics domain to better understand hiring patterns, salary distribution, required technical skills, and industry demand across different regions. With the rapid growth of data-driven technologies, companies are continuously looking for skilled professionals such as Data Scientists, Data Analysts, Data Engineers, Machine Learning Engineers, and Business Intelligence specialists. However, the hiring landscape has become highly competitive and dynamic, making it difficult for organizations, recruiters, and job seekers to identify key market trends and opportunities.

Deliverables

- 1 **Data Preparation & Modeling (Python):** Clean and transform the raw job market dataset for analysis, handle missing values, preprocess salary and location data, and prepare structured features for analytical workflows.
- 2 **Data Analysis (SQL):** Organize the dataset into a structured format and run SQL queries to analyze hiring trends, salary patterns, top companies, job titles, industries, and in-demand technical skills.
- 3 **Visualization & Insights (Power BI):** Build an interactive dashboard that highlights job market trends, salary analysis, state-wise hiring distribution, skill demand, and industry insights for better decision-making.
- 4 **Report and Presentation:** Prepare a project report summarizing key findings, analytical insights, and business recommendations. Create a presentation that clearly communicates important trends and actionable insights.
- 5 **GitHub Repository:** Include all Python scripts, SQL queries, cleaned datasets, dashboard files, and project documentation in a properly structured GitHub repository.
